Lesson 118
Methods of Division (1)
(اساليب القسمة)

- The difference between natural and logical division: In logical division, the divisions can be predicated on dividends and vice versa, but in natural division, it is not possible in all types of natural division.
- There should be a common aspect while doing a logical division; simultaneously, there should be a difference between divisions.
- Methods of Division: To divide a thing correctly, the division must include all the divisions in it and exclude others; then division is through two methods:
 - A. Binary (by two contradictory sides, negating or affirming), such as dividing animals into rational and non-rational.
 - B. Elaborative (to bring all the divisions), such as dividing the universals into the five.
- The word that signifies an essence is a noun; the word that signifies time is a verb, and the word that does not signify both is an article.
